

AMENDMENTS TO THE SPECIFICATION

Please amend the paragraph beginning on page 13, line 3, as follows:

One example of a state of an MS when in the RER mode is a Control Hold state. The Control Hold state is well-known and is described in IS-25000-D. In such a state, MS 102 is not able to immediately ~~began~~ begin full-duplex communication with the network over a dedicated RF channel or resource, but rather must suffer some amount of latency. However, when in such state, MS 102 uses significantly less resources than would be the case if it was simply placed in the Traffic state
